

PROTOCOLE OPERATOIRE / OPERATIVE REPORT

Site: Ste-Agathe Hospital

Date: 2023-12-27 08:59

Anesthésiste / Anesthetist: Dr. Lisa Garcia

Chirurgien / Surgeon: Dr. Sarah Johnson

Assistant(s): Dr. resident Jake Turner

Diagnostic préopératoire / Pre-operative diagnosis:

ACUTE APPENDICITIS WITH PERITONITIS.

Diagnostic postopératoire / Post-operative diagnosis:

PERFORATED APPENDICITIS.

Opération / Operation:

APPENDECTOMY WITH INTRA-ABDOMINAL DRAINAGE.

Tissu envoyé en pathologie / Tissue sent to pathology: Appendix and peri-appendiceal tissue

Anesthésie / Anesthesia: General anesthesia with mask induction

Historique et constatations opératoires / History and operative findings:

A 10-year-old non-binary with 1 day history of abdominal pain after trauma. Failed conservative management for viral syndrome. Imaging: CT scan revealing free fluid.

Procédure(s) opératoire(s) / Operative procedure(s):

Patient in supine position. General anesthesia with nitrous oxide administered. Time-out was performed and abdomen prepped in sterile fashion. Direct trocar insertion after skin and fascia incision. Supplementary ports are placed in the suprapubic area and left iliac fossa. No iatrogenic injuries occurred during trocar placement. Upon entering the abdominal cavity, moderate adhesions noted. Findings include hyperemic appendix with patchy inflammatory changes. Multiple small abscesses were encountered. Fibrinous adhesions were lysed during the procedure. The appendix is mobilized using a combination of sharp and blunt dissection. We dissect the mesentery of the appendix and use the electrocautery to coagulate the artery. The appendix is ligated at its base with two absorbable sutures and then amputated. Specimen placed in EndoCatch bag for removal. Irrigation performed with antibiotic solution. All port sites closed with Steri-Strips. No need for drains postoperatively.

Early ambulation and supportive care recommended. The patient tolerated the procedure well with minimal blood loss.
