

# PROTOCOLE OPERATOIRE / OPERATIVE REPORT

Site: Jewish General Hospital

Date: 2025-02-06 05:50

Anesthésiste / Anesthetist: Dr. Claire Dubois

Chirurgien / Surgeon: Dr. James Wilson

Assistant(s): Dr. resident Marc Gagnon

Diagnostic préopératoire / Pre-operative diagnosis:

**APPENDICITIS WITH SEPSIS.**

Diagnostic postopératoire / Post-operative diagnosis:

**APPENDICITIS WITH BOWEL OBSTRUCTION.**

Opération / Operation:

**LAPAROSCOPIC APPENDECTOMY WITH OMENTAL WRAPPING.**

Tissu envoyé en pathologie / Tissue sent to pathology: Appendix and inflamed tissue

Anesthésie / Anesthesia: General anesthesia with nitrous oxide

## Historique et constatations opératoires / History and operative findings:

A 6-year-old non-binary who presented with abdominal pain with rebound tenderness. Initially evaluated 2 days prior and diagnosed with constipation. Now has normal WBC, elevated CRP, low-grade fever. Imaging: CT scan showing peri-appendiceal fluid.

## Procédure(s) opératoire(s) / Operative procedure(s):

Patient in supine position. Total intravenous anesthesia administered. Time-out was performed and abdomen prepped in sterile fashion. A vertical infraumbilical incision is made and carried down to the fascia which is incised sharply. Single-incision laparoscopic port is used. No iatrogenic injuries occurred during trocar placement. Upon entering the abdominal cavity, diffuse adhesions noted. The appendix was phlegmonous with diffuse inflammation. No pus or abscess formation found. The omentum was wrapped around the inflamed appendix. No need for drains postoperatively. Appendix is isolated after adhesiolysis. The mesoappendix is dissected and the appendiceal artery is controlled with electrocautery. Endoscopic stapling is used for appendiceal division. Specimen placed in EndoCatch bag for removal. Saline is used for thorough irrigation of all quadrants. All port sites closed with interrupted nylon 4-0.

Postoperative imaging if fever persists. The patient tolerated the procedure well with minimal blood loss.
