Historique et constatations opératoires / History and operative findings:

A 10-year-old female with several hours history of persistent vomiting and abdominal pain. Failed conservative management for IBD. Imaging: ultrasound reporting lymphadenopathy.

Procédure(s) opératoire(s) / Operative procedure(s):

Patient in supine position. General anesthesia with nitrous oxide administered. Time-out was performed and abdomen prepped in sterile fashion. We create a 1 cm infraumbilical incision and enter the abdomen using the Hasson technique. Single-incision laparoscopic port is used. No iatrogenic injuries occurred during trocar placement. Upon entering the abdominal cavity, moderate adhesions noted. Appendix was friable and surrounded by A large pelvic abscess was present and evacuated. and No abnormal adhesions found. Dissection is carried out to isolate the base of the appendix. The mesoappendix is dissected and the appendiceal artery is controlled with electrocautery. We secure the appendiceal base with two Endoloops and transect between them. Specimen placed in EndoCatch bag for removal. We lavage the abdomen extensively, paying particular attention to the pelvis and right gutter. The umbilical fascia is reapproximated with interrupted PDS 3-0 sutures. Skin incisions are closed with Dermabond.

Monitor wound sites for infection. The patient tolerated the procedure well with minimal blood loss.
