US ABDOMEN/PELVIS- SUSPECTED APPENDICITIS

Date of exam / Exam Date

May 11, 2019 11:39

RENSEIGNEMENT CLINIQUE / CLINICAL INFORMATION:

Patient with previous appendectomy presenting with RLQ pain.

PROTOCOLE RADIOLOGIQUE / RADIOLOGIST'S REPORT:

ULTRASOUND OF ABDOMEN AND PELVIS WITH DOPPLER

No previous for comparison.

FINDINGS:

The liver shows mild increased echogenicity, likely due to technical factors. No focal hepatic lesions detected. Gallbladder wall is thin. No sonographic findings suggestive of cholecystitis. Both kidneys are symmetric in size and show normal corticomedullary differentiation. No perisplenic fluid collections. No vesicoureteral reflux seen. Visualization limited by patient movement and bowel gas. Minimal pelvic fluid, likely physiologic. No evidence of abscess or phlegmon. Liver contour is smooth; no masses seen.

IMPRESSION:

Indeterminate RLQ findings.

Clinical correlation recommended. If high suspicion persists, consider surgical evaluation.
