US ABDOMEN/PELVIS- SUSPECTED CROHN'S DISEASE

Date of exam / Exam Date

June 15, 2020 06:44

RENSEIGNEMENT CLINIQUE / CLINICAL INFORMATION:

15-year-old Male with 3 days of RLQ pain and loss of appetite.

PROTOCOLE RADIOLOGIQUE / RADIOLOGIST'S REPORT:

ULTRASOUND OF ABDOMEN AND PELVIS WITH DOPPLER

No previous for comparison.

FINDINGS:

The liver shows mild increased echogenicity, likely due to technical factors. No signs of portal hypertension. No gallstones, wall thickening, or pericholecystic fluid. Renal sinus anatomy is intact. Spleen size within normal limits. Bladder demonstrates normal wall thickness. Significantly dilated (10mm) appendix, non-compressible, with wall edema. Minimal pelvic fluid, likely physiologic. No evidence of abscess or phlegmon.

IMPRESSION:

Acute appendicitis with secondary signs present.

Recommend urgent surgical consultation.

Case ID: CASE-C4IRD8-11415
