

PROTOCOLE OPERATOIRE / OPERATIVE REPORT

Site: Hopital Notre-Dame

Date: 2024-04-26 02:00

Anesthésiste / Anesthetist: Dr. Amélie Moreau

Chirurgien / Surgeon: Dr. Martin Levesque

Assistant(s): Dr. resident Ethan Wright

Diagnostic préopératoire / Pre-operative diagnosis:

SUPPURATIVE APPENDICITIS.

Diagnostic postopératoire / Post-operative diagnosis:

SUPPURATIVE APPENDICITIS.

Opération / Operation:

LAPAROSCOPIC APPENDECTOMY WITH IRRIGATION AND DRAINAGE.

Tissu envoyé en pathologie / Tissue sent to pathology: Appendix and inflamed tissue

Anesthésie / Anesthesia: General anesthesia

Historique et constatations opératoires / History and operative findings:

A 2-year-old non-binary with 2 days history of abdominal pain with distention. Failed conservative management for IBD. Imaging: CT scan showing peri-appendiceal fluid. Past medical history is otherwise unremarkable.

Procédure(s) opératoire(s) / Operative procedure(s):

Patient in supine position. General anesthesia administered. Time-out was performed and abdomen prepped in sterile fashion. Direct trocar insertion after skin and fascia incision. Single-incision laparoscopic port is used. No iatrogenic injuries occurred during trocar placement. Upon entering the abdominal cavity, significant adhesions noted. Intraoperative examination revealed hyperemic appendix. Multiple small abscesses were encountered. Mild adhesions between bowel loops observed. The surrounding tissues showed localized reaction. Blunt dissection is used to free the appendix from surrounding structures. Appendiceal vessels controlled with clips. Absorbable ligatures are applied prior to amputation. Specimen placed in EndoCatch bag for removal. We irrigate the abdominal cavity copiously with warm saline until the effluent is clear. We close the fascia with Ethibond 2-0 in a interrupted fashion. Skin is approximated with subcuticular Vicryl 4-0.

IV fluids and pain management as per protocol. The patient tolerated the procedure well with minimal blood loss.
