

# PROTOCOLE OPERATOIRE / OPERATIVE REPORT

Site: Hopital Charles-LeMoyne

Date: 2024-10-18 05:02

Anesthésiste / Anesthetist: Dr. Rachel Stein

Chirurgien / Surgeon: Dr. Elena Rodriguez

Assistant(s): Dr. resident Leo Morel

Diagnostic préopératoire / Pre-operative diagnosis:

**SUPPURATIVE APPENDICITIS.**

Diagnostic postopératoire / Post-operative diagnosis:

**SUPPURATIVE APPENDICITIS.**

Opération / Operation:

**LAPAROSCOPIC APPENDECTOMY WITH DRAINAGE OF ABSCESS.**

Tissu envoyé en pathologie / Tissue sent to pathology: Appendix with attached omentum

Anesthésie / Anesthesia: General anesthesia

## Historique et constatations opératoires / History and operative findings:

17-year-old male with 3 days abdominal pain. Treated for viral syndrome; symptoms persisted. Imaging: MRI showing bowel wall thickening.

## Procédure(s) opératoire(s) / Operative procedure(s):

Patient in supine position. General endotracheal anesthesia administered. Time-out was performed and abdomen prepped in sterile fashion. Incision is made in left lower quadrant for open conversion. Single-incision laparoscopic port is used. No iatrogenic injuries occurred during trocar placement. Upon entering the abdominal cavity, extensive adhesions noted. The appendix was ruptured with patchy inflammation. Multiple small abscesses were encountered. Severe adhesions required careful lysis. Minimal intraoperative blood loss. We carefully dissect the inflammatory mass and identify the friable appendix. The appendiceal mesentery is carefully taken down with harmonic scalpel. The base of the appendix is healthy and we place three EndoLoops - two proximal and one distal - before transecting the appendix. Specimen placed in EndoCatch bag for removal. Copious irrigation is undertaken to ensure removal of all inflammatory debris. Umbilical port site is closed with Ethibond 2-0 and skin with Steri-Strips.

Early ambulation and supportive care recommended. No mesenteric ischemia. The patient tolerated the procedure well with minimal blood loss.
