

# PROTOCOLE OPERATOIRE / OPERATIVE REPORT

Site: Hopital Charles-LeMoynes

Date: 2024-03-19 21:07

Anesthésiste / Anesthetist: Dr. Omar Fahmy

Chirurgien / Surgeon: Dr. Robert Tremblay

Assistant(s): Dr. resident Chloe Nguyen

Diagnostic préopératoire / Pre-operative diagnosis:

**ACUTE APPENDICITIS.**

Diagnostic postopératoire / Post-operative diagnosis:

**ACUTE APPENDICITIS.**

Opération / Operation:

**OPEN APPENDECTOMY.**

Tissu envoyé en pathologie / Tissue sent to pathology: Appendix and abscess wall

Anesthésie / Anesthesia: General anesthesia with mask induction

## Historique et constatations opératoires / History and operative findings:

A 1-year-old male with 3 days history of abdominal pain with distention. Failed conservative management for intussusception. Imaging: ultrasound suggestive of appendicitis. Past medical history is otherwise unremarkable.

## Procédure(s) opératoire(s) / Operative procedure(s):

Patient in supine position. General endotracheal anesthesia administered. Time-out was performed and abdomen prepped in sterile fashion. Direct trocar insertion after skin and fascia incision. Three trocars in total are used for laparoscopic access. No iatrogenic injuries occurred during trocar placement. Upon entering the abdominal cavity, extensive adhesions noted. Operative findings included perforated appendix and mild inflammation. No abscess was identified. Severe adhesions required careful lysis. We proceed with careful dissection of the appendiceal attachments. The mesoappendix is dissected and the appendiceal artery is controlled with electrocautery. We apply an endoscopic stapler to the base of the appendix and divide it. Specimen placed in EndoCatch bag for removal. Thorough irrigation of the abdominal cavity is performed, removing all purulent material. Umbilical port site is closed with PDS 3-0 and skin with interrupted silk 4-0.

Early ambulation and supportive care recommended. The patient tolerated the procedure well with minimal blood loss.
