Historique et constatations opératoires / History and operative findings:

Pediatric patient (5, non-binary) presenting with acute onset abdominal pain with palpable mass. History: history of constipation. Imaging confirmed appendicitis.

Procédure(s) opératoire(s) / Operative procedure(s):

Patient in supine position. General anesthesia and epidural block administered. Time-out was performed and abdomen prepped in sterile fashion. Direct trocar insertion after skin and fascia incision. Two working ports are established in the right and left lower quadrants. No iatrogenic injuries occurred during trocar placement. Upon entering the abdominal cavity, significant adhesions noted. Appendix was ruptured and surrounded by No abscess was identified. and The appendix was adhered to surrounding structures. Blunt dissection is used to free the appendix from surrounding structures. The mesoappendix is divided using a bipolar energy device. The base of the appendix is healthy and we place three EndoLoops - two proximal and one distal - before transecting the appendix. Specimen placed in EndoCatch bag for removal. Copious irrigation is undertaken to ensure removal of all inflammatory debris. All port sites closed with subcuticular Vicryl 4-0.

The patient will be continued on IV antibiotics and advanced to diet as tolerated. The patient tolerated the procedure well with minimal blood loss.
