Diagnostic postopératoire / Post-operative diagnosis:

APPENDICITIS WITH SEPSIS.

Opération / Operation:

LAPAROSCOPIC APPENDECTOMY.

Tissu envoyé en pathologie / Tissue sent to pathology: Appendix and peri-appendiceal tissue

Anesthésie / Anesthesia: General anesthesia with nitrous oxide

Historique et constatations opératoires / History and operative findings:

Patient (17 years, male) presented with abdominal pain with fever, elevated WBC, high CRP. Imaging: CT scan showing appendiceal abscess.

Procédure(s) opératoire(s) / Operative procedure(s):

Patient in supine position. General anesthesia with caudal block administered. Time-out was performed and abdomen prepped in sterile fashion. Transverse infraumbilical incision is performed and access gained via blunt dissection. Supplementary ports are placed in the suprapubic area and left iliac fossa. No iatrogenic injuries occurred during trocar placement. Upon entering the abdominal cavity, diffuse adhesions noted. The appendix was sclerotic with fluctuating inflammation. A large pelvic abscess was present and evacuated. Multiple bowel loops adherent to the mass. Dissection is carried out to isolate the base of the appendix. The appendiceal mesentery is carefully taken down with harmonic scalpel. Absorbable ligatures are applied prior to amputation. Specimen placed in EndoCatch bag for removal. Thorough irrigation of the abdominal cavity is performed, removing all purulent material. We close the fascia with Maxon 2-0 in a interrupted fashion. Skin is approximated with subcuticular Monocryl 4-0. No evidence of malignancy.

Postoperative imaging if fever persists. No mesenteric ischemia. The patient tolerated the procedure well with minimal blood loss.
