Opération / Operation:

LAPAROSCOPIC APPENDECTOMY WITH OMENTAL WRAPPING.

Tissu envoyé en pathologie / Tissue sent to pathology: Appendix and mesoappendix

Anesthésie / Anesthesia: General anesthesia

Historique et constatations opératoires / History and operative findings:

8-year-old male with 2 days abdominal pain. Treated for urinary tract infection; symptoms persisted. Imaging: CT scan confirming appendicitis.

Procédure(s) opératoire(s) / Operative procedure(s):

Patient in supine position. General anesthesia with mask induction administered. Time-out was performed and abdomen prepped in sterile fashion. A vertical infraumbilical incision is made and carried down to the fascia which is incised sharply. Supplementary ports are placed in the suprapubic area and left iliac fossa. No iatrogenic injuries occurred during trocar placement. Upon entering the abdominal cavity, diffuse adhesions noted. Intraoperative examination revealed distended appendix. A small localized abscess was found and drained. The appendix was adhered to surrounding structures. The surrounding tissues showed mild reaction. No evidence of peritoneal carcinomatosis. Appendix is isolated after adhesiolysis. Appendiceal vessels controlled with clips. We apply an endoscopic stapler to the base of the appendix and divide it. Specimen placed in EndoCatch bag for removal. Irrigation performed with antibiotic solution. The umbilical fascia is reapproximated with interrupted Ethibond 2-0 sutures. Skin incisions are closed with Steri-Strips.

Discharge home when tolerating oral intake and afebrile. The patient tolerated the procedure well with minimal blood loss.
