US ABDOMEN/PELVIS- SUSPECTED CROHN'S DISEASE

Date of exam / Exam Date

August 11, 2022 16:13

RENSEIGNEMENT CLINIQUE / CLINICAL INFORMATION:

16-year-old Male with sudden onset of abdominal pain and history of constipation.

PROTOCOLE RADIOLOGIQUE / RADIOLOGIST'S REPORT:

ULTRASOUND OF ABDOMEN AND PELVIS WITH DOPPLER

No previous for comparison.

FINDINGS:

No focal hepatic lesions detected. No sonographic findings suggestive of cholecystitis. No gallstones, wall thickening, or pericholecystic fluid. Both kidneys are symmetric in size and show normal corticomedullary differentiation. Spleen appears normal for age. Bladder wall shows no abnormal thickening. Appendix not clearly identified despite thorough evaluation. Minimal pelvic fluid, likely physiologic. Mesenteric fat appears normal.

IMPRESSION:

Indeterminate RLQ findings.

Clinical correlation recommended. If high suspicion persists, consider surgical evaluation.

Case ID: CASE-73KLCZ-13173
