PROTOCOLE OPERATOIRE / OPERATIVE REPORT

Site: Hopital Maisonneuve-Rosemont Date: 2025-09-15 18:57

Anesthésiste / Anesthetist: Dr. David Smith

Chirurgien / Surgeon: Dr. Samuel Lee Assistant(s): Dr. resident Carlos Mendez

Diagnostic préopératoire / Pre-operative diagnosis:

APPENDICITIS WITH INTUSSUSCEPTION.

Diagnostic postopératoire / Post-operative diagnosis:

ACUTE APPENDICITIS.

Opération / Operation:

APPENDECTOMY WITH INTRA-ABDOMINAL DRAINAGE.

Tissu envoyé en pathologie / Tissue sent to pathology: Appendix and inflamed tissue

Anesthésie / Anesthesia: General anesthesia with caudal block

Historique et constatations opératoires / History and operative findings:

Patient (9 years, female) presented with abdominal pain with distention, elevated WBC, elevated CRP. Imaging: ultrasound showing phlegmonous appendicitis.

Procédure(s) opératoire(s) / Operative procedure(s):

Patient in supine position. General anesthesia with nitrous oxide administered. Time-out was performed and abdomen prepped in sterile fashion. A vertical infraumbilical incision is made and carried down to the fascia which is incised sharply. Additional 5 mm trocars are placed in the right and left lower quadrants under laparoscopic guidance. No iatrogenic injuries occurred during trocar placement. Upon entering the abdominal cavity, significant adhesions noted. Appendix appeared friable, surrounded by patchy inflammatory reaction. No abscess, but turbid fluid present. The omentum was wrapped around the inflamed appendix. Blunt dissection is used to free the appendix from surrounding structures. Appendiceal vessels controlled with clips. The appendix is ligated at its base with two absorbable sutures and then amputated. Specimen placed in EndoCatch bag for removal. Abdominal lavage performed until clear. All port sites closed with interrupted nylon 4-0.

Consult infectious disease if antibiotics need adjustment. Patient tolerated procedure well. The patient tolerated the procedure well with minimal blood loss.

Case ID: CASE-UA4KVP-11231
